

### Distance workshop

- (1) Find the distance from a point  $P_0$  to a line  $L$ .
- Describe  $L$  using a direction vector  $\mathbf{v}$  and a specific point  $P_1$  on  $L$ .
  - Let  $P_2$  be the point on  $L$  closest to  $P_0$ .
  - Let  $\mathbf{r}_0$  be the vector from the origin to  $P_0$ .
  - Let  $\mathbf{r}_1$  be the vector from the origin to  $P_1$ .
  - Label the picture.

- Use trigonometric identities to describe relationships between as many lengths as you can.
  - Solve for the distance from  $P_0$  to  $L$ .
- (2) Find the distance from the point  $P_0 = (1, 1, -1)$  to the line  $L$  of intersection between the planes

$$x + y + z = 1, \quad 2x - y - 5z = 1.$$

- Explain why the direction vector of  $L$  is  $\mathbf{v} = \mathbf{n}_1 \times \mathbf{n}_2$ , where  $\mathbf{n}_1 = \mathbf{i} + \mathbf{j} + \mathbf{k}$ , and  $\mathbf{n}_2 = 2\mathbf{i} - \mathbf{j} - 5\mathbf{k}$ .
  - Find  $\mathbf{v}$ .
  - Pick  $P_1 = (1, \frac{-1}{4}, \frac{1}{4})$  on the line. How far is  $P_1$  from the closest point to  $P_0$  on  $L$ ?
  - What is the distance from  $P_0$  to each of the two planes?
- (3) If  $L_1$  and  $L_2$  are parallel lines which don't intersect, find the distance between them.

Hint: pick an arbitrary point on each line and connect them by a vector. How does the distance relate to this vector? Draw a picture!
